28-year average, 1909-10--1936-37	1,000,806	127.8	137	90.8	9,960	100.26	120.2	85.7

1/ Cash income from lint for each crop year expressed as a ratio of the 1909-1913 average.

2/ The purchasing power of lint is obtained by dividing the index of cash income from lint by the index of prices farmers pay.

3/ Estimated from Census reports on farm population in the principal cotton growing States, also BAE estimates of farm population in the geographic divisions which include the Cotton Belt for non-census years and the ratio of farms reporting cotton to all farms in those States. Estimates of population on farms growing cotton in these 10 States were raised slightly (2 to 3 percent) to allow for population on farms growing cotton in the minor cotton growing States. Census data were used as a basis for those adjustments.

4/ Ratio of per capita income for each year to the 1909-1913 average.

5/ The purchasing power of cash income per capita is obtained by dividing the index of cash income from lint per capita by the index of prices farmers pay.
